

File System Assessment

DNM Technology was formed in 2000 by a group of leading IT technology specialists.

It's goal is to become a leading infrastructural services company specialising in:

- Enterprise database solutions from Oracle, Sybase & Microsoft
- Virtualisation technologies from VMware, Xen and Microsoft
- Enterprise system management solutions from Nimsoft, BMC, Bradmark & Quest
- Infrastructure design
- Performance diagnostics and troubleshooting
- Disaster recovery design and implementation
- Enterprise high-available SAN solutions from EMC, Dell, Fujitsu and HP
- Storage & backup solution from Symantec and EMC

Experience shows that 70 percent of the data in primary storage environments is no longer being actively accessed or modified. DNM Technology's File System Assessment Service helps you quickly identify ways to eliminate this waste and develop a customised action plan to optimise your upstream storage environment. Implementation of this plan will result in faster access to data as well as lower costs for storage, archiving and backups.

Background

Most organisations are experiencing an explosive growth of data which dramatically impairs end-user productivity and backup efficiency.

DNM Technology helps you quickly understand your file server data environment and identify areas for improvement. It is the first step toward dramatically improving end-user data access, reducing overall backup and recovery times, and lowering your total cost of ownership.

This quick, non-disruptive service identifies:

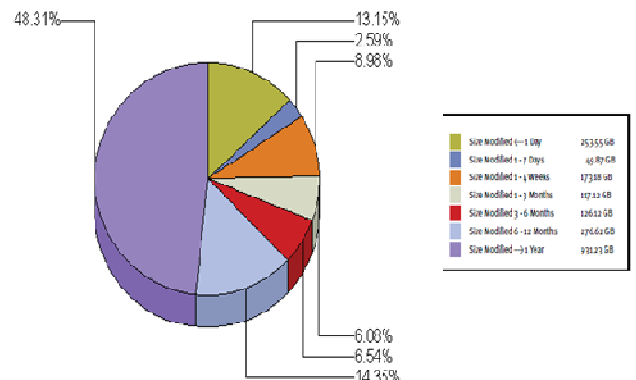

- Capacity utilisation
- File age distribution
- Space consumption by file types
- Last access
- Modification times

Through this service, DNM Technology delivers reports that can be easily understood by management and other stakeholders to help you form consensus around an action plan.

Get insight within hours

Using advanced tools DNM Technology will install a small program on your network, either on your fileserver or remotely. This application will then scan all or some of your file servers.

Our in-depth report analyses your company's data storage usage patterns and points out potential cost reductions through alternative data management options and strategies.

File System Assessment Service Includes:

- Summary of analysis and recommendations
- Analysis of all information gathered
- Recommendations for actions
- Reports, including:
 - Old or static files suitable for migration to a lower tier of storage
 - Space consumption grouped by file type
 - Percentage of duplicated content (multiple copies of the same file)
 - Percent of capacity used by largest consumers of disk space
 - Problems with files

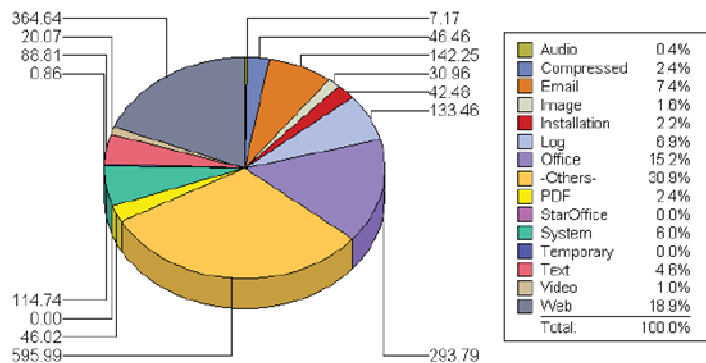

Benefits

- Better understanding of file aging, including how many are not being accessed or modified, and how many could be taken out of weekly and monthly backup cycles
- Realisation of how much production capacity could be reclaimed if this content were moved from the production tier to a self-managed archive tier, like EMC Centera™ storage solution. This increased production capacity will significantly improve data access rates
- Identification of types of content residing on server(s) and who produced them
- Identification of opportunities to save through strategies that include setting up tiered backups, archiving to lower- cost solutions, and more

Space Consumption Grouped By File Type

Entire System
